

C LCNC

**SAP Certified Associate - SAP
Build
Developer**

EXERCISES

Course Version: 2511

Introduction

In this system-based assessments you will work on one or more scenarios. Each scenario consists of a set of tasks that you must complete in the system. The scenarios and their corresponding tasks are described below.

For some tasks, you may need to enter specific data into the system. This data is provided in the instructions. You can copy this data directly from this document. Please make sure to follow the instructions carefully.

After completing all required tasks, you must select “**Submit assessment.**” Please note that once you submit the assessment, no further changes can be made. Take your time to read each of the instructions carefully. Make sure all required steps are completed before you submit your assessment.

After you submit, the system will automatically validate your work. Based on this validation, your final score for the assessment will be calculated.

We advise you to manage your time carefully. The assessment is time-limited, and incomplete tasks may affect your final score. If you encounter any technical issues during the assessment (for example, system errors), follow the instructions.

Before starting the assessment, please make sure to follow these important preparation steps:

- Clear your browser cache before beginning the assessment to avoid potential loading or validation issues.
- Do not open unnecessary tabs or windows in your browser while working on the tasks. Multiple open tabs may cause session conflicts or performance problems.
- Use a stable internet connection and ensure that your browser (preferably Google Chrome or Microsoft Edge) is up to date.
- Always save and check your progress before submitting.

You may also be required to enter a certification number <CERT####>. Please make sure to replace #### with your assigned number. **The correct use of this number is essential for proper evaluation of your work.** Sometimes this number is part of the name of a file that you are asked to create. Enter the filename exactly as provided in the instructions. Not following this instruction may result in a failed task.

Hint: Click on the top right corner of the SAP Build Lobby to find your user first name as **CERT####**.

Example: If your group number is 0123 your user will be CERT0123.

Scenarios

This assessment consists of two scenarios:

- Create a process for leave requests
- Create a Simple App and Trigger a Process

While you can complete the scenarios in any order we recommend that you complete the tasks in the order described in this handbook.

Scenario 1

Create a process for leave requests

Objective

Create, deploy, and run a Leave Request Process in SAP Build Process Automation. This workflow

- will allow employees to submit leave requests digitally,
- applies approval rules automatically, and
- provides notifications.

Scenario Description

An employee submits a leave request that needs to be processed efficiently and transparently.

The process should automatically route requests according to predefined workflow rules. Short leaves are auto-approved, while longer ones are forwarded to the manager for review in My Inbox.

Before you begin, create your own environment in the Control Tower. This environment will be used to deploy and test your process.

The process will be created in three incremental versions:

1. Basic Process – Create your environment, trigger form, and manager approval workflow.
2. Enhanced Process – Add approval and rejection notifications
3. Final Process – Add conditional logic for automatic approval of short leaves.

Task Summary

- 1 Create your environment, then build the trigger form and manager approval workflow
- 2 Add approval and rejection notifications
- 3 Add conditional logic for automatic approvals of short medical leave (≤ 3 days)

Task 1 Prepare Your Environment, Create the Trigger Form and Manager Approval Workflow

Use the ID **CERT####** (see **Introduction**) for both your environment and project names to ensure consistency.

1. Environment name: **cert#### (lower case)**
2. Project name: **Leave_Request_CERT####**
3. Process name: **Leave_Request_CERT####**

1.1 Create Your Environment and add a short description

- a. Go to Control Tower → Tenant Configuration → Environments.
- b. Select Create Environment.
- c. Enter a name using your user ID (example: **cert####** (lower case)).
- d. Choose Create.

1.2 Create a new project called “**Leave_Request_CERT####**”, #### is your Group Number.

1.3 Inside the project, create a new process with the same name as your project, with the exact same format: **Leave_Request_CERT####**.

1.4 Add a trigger form (Submit a Form) to start the process.

1.5 Add the following fields to the trigger form

Type	Name	Configuration
H1	Employee Information	-
Text	Employee Name	Required
date	Start Date	Required
date	End Date	Required
number	Number of Leave Days	Required
Dropdown	Type of Leave Option 1: medical Option 2: annual	Required

H2	Submission Information	-
----	------------------------	---

- 1.6 Add an Approval Form (Manager Approval), and make sure to map the required fields from the Trigger Form.

1.7 Release, deploy, and run the process as follow:

- a. Release version 1 of the process.
- b. Deploy the process to your created environment cert#### (only deployments in this cert#### environment will be checked).
- c. Once the process is deployed and active, open the process and click on the Trigger Form.
- d. A link will be generated — copy this link, open it in a new browser tab, and fill in the required parameters to start the process.

1.8 Verify that the workflow runs successfully in My Inbox, and check that the Manager Approval task is available, and make sure to click one of the buttons *Approve* or *Reject* to complete the task.

Note: In Process Panel, carefully review the General and Inputs tabs for each form step—such as Approval or Forms—as these settings determine the form’s behavior, displayed information, and task recipients.

- **Subject** – Acts as the task title and helps the recipient quickly understand what the task or message is about.
Example: “Request from [Employee Name]”
This helps the approver immediately identify whose request they are handling.
- **Recipients** – Defines who receives the task or notification. For this exam scenario, select **Started By** to assign it to yourself.

2 Add approval and rejection forms

2.1 Extend the process by adding two forms

- Approval Form
- Rejection Form

2.2 Include all request details in each confirmation.

2.3 Release, deploy, and run the process.

- Release version 2 of the process and deploy it to your created environment CERT#### .
- Once the process is deployed and active, open the process, and click on the Trigger Form. A link will be generated. Copy this link, open it in a new browser tab, and fill in the required parameters to start again the process

2.4 Verify that the approval form is triggered correctly. **Check and submit only the approval form in My Inbox.**

3 Add conditional logic for automatic approvals

3.1 Add a condition based on the process variables NoOfDaysLeave and Leave Type

- If Leave Type = Medical Leave and NoOfDaysLeave $\leq$ 3 = auto approved
- Result: Auto-Approval Notification

3.2 Create an Auto-Approval Form for the case where the request is approved automatically.

3.3 Ensure that auto approval is fully configured with all request details.

3.4 Release, deploy, and run the process again.

- Release version 3 of the process and deploy it to your created environment CERT#### .
- Once the process is deployed and active, open the process, and click on the Trigger Form. A link will be generated. Copy this link, open it in a new browser tab, and fill in the required parameters to start again the process.

3.5 Test the following scenarios:

- Medical Leave, 2 days = auto-approved (Auto-Approval Form).
- Annual Leave, 5 days = rejected by manager (Rejection Form)

3.6 Verify that the process works end to end. Check that both the auto-approval and manager approval logic function correctly, and that all results are traceable in **My Inbox**.

Scenario 2

Create a Simple App and Trigger a Process

Objective

Design a small trigger app in SAP Build Apps that lets participants enter their name and start a process within SAP Build.

At the end of this scenario, you will have created and bound page variables and used logic flows to trigger process execution.

Scenario Description

Design a small registration app in SAP Build Apps that lets participants enter their name and start a process within SAP Build.

Task Summary

- 1 Prepare the UI
 - 1.1 Create a new front end
 - 1.2 Create a page variable and bind the input field's value
- 2 Integrate the workflow
 - 2.1 Enable the process
 - 2.2 Trigger the process flow function
 - 2.3 Map the input fields and save
- 3 Preview and execute
 - 3.1 Preview and execute

1 Prepare the UI

1.1 In SAP Build Lobby, create a new Frontend → Web & Mobile app.

1.2 App name (exact pattern): Trigger Application – < CERT####>

Open the App Editor, home page. Add

- Input field
- Button labeled Start Process

Create a Page Variable:

- Name: firstName
- Type: Text

Bind the input field's Value to the page variable firstName.

2 Integrate the workflow

2.1 Enable the process from SAP Build Library: Cert_Trigger_Process (Description: C_LCNC Exam Process).

11

2.2 On the Start Process button, open Logic and add:

- Trigger process flow function (connect to Tap event)
- Toast (success) chained from the Success output
- Toast (error) chained from the Error output

2.3 In Trigger process:

- Select Integration Process.
- Map inputs: firstName → Page variable: firstName

2.4 Save the project.

3 Preview and execute

3.1 Click Preview on web in the App Editor.

3.2 In the preview window, enter your participant <CERT####> into the input field.

- Click the Start Process button to trigger the process.

3.3 Wait for the toast message to appear:

- If you see the success toast, the process was triggered successfully.
- If you see the error toast, review your logic setup and input mapping.

Final step

When you are finished with all tasks select the “**Confirm completion**” button to submit your work.
